

Baseline Audit: Issues Identified Log

Project: Advanced Media Production Website

Total Errors Found: 58 (27 HTML / 31 CSS)

Status: Pre-Remediation Review

1. The Big Picture (Where the Starter Code Fails)

The starter code is essentially a raw skeleton that breaks almost every rule required for a passing grade. Here is how it stacks up against what we actually need to deliver:

- **HTML Structure:** We need at least 7 semantic tags per page. The starter code uses zero—it's just a giant mess of generic `<div>` blocks.
- **Media Assets:** The requirements ask for 2 videos with fallbacks, an audio player, and an embedded iframe. The starter code gives us 1 broken video tag and nothing else.
- **Form & Data:** The contact form only has 3 basic text fields with no labels or validation rules, failing the requirement for 7 distinct input types with proper validation.
- **CSS Layouts:** No Flexbox or Grid layouts are used anywhere in the files. The layouts are completely static, which makes them break immediately on mobile screens.
- **Animations & Selectors:** There are no transitions, transforms, interactive hover states, or clean combination selectors in the stylesheet.

2. Breakdown of the 27 HTML Errors

Global Framework Problems (Affects all 4 HTML files)

- **Missing Project Essentials (Errors 1–4):** None of the pages have a `lang` attribute on the `<html>` tag. They are also missing basic `<meta>` tags for the character set (UTF-8), the mobile viewport scale, and SEO page descriptions.
- **Div-itis / Zero Semantics (Errors 5–8):** The code uses lazy wrappers like `<div class="header">` and `<div class="footer">` instead of using the correct semantic tags (`<header>`, `<nav>`, `<main>`, `<section>`, `<article>`, `<aside>`, `<footer>`).
- **Accessibility Failures (Errors 9–12):** Every single image tag (`<img>`) is missing its `alt` attribute, which completely breaks accessibility guidelines.
- **Broken Figure Formatting (Errors 13–16):** Showcase images are dropped in raw without being wrapped in proper `<figure>` and `<figcaption>` layout structures.

Broken Elements on `media.html`

- **Error 17:** The single `<video>` tag is missing the `controls` attribute, meaning a user can't click play or pause.
- **Error 18:** There is no fallback text inside the video element to show a helpful message if a browser fails to load it.
- **Error 19:** The page only has one broken video element instead of the 2 distinct video blocks required by the rubric.
- **Error 20:** The native `<audio>` element is completely missing from the markup.
- **Error 21:** There is no map integration or `<iframe>` layout set up to showcase the studio's physical address.

Contact Form Weaknesses on `contact.html`

- **Error 22:** The form only features 3 input fields instead of the 7 unique field types required to pass.
- **Error 23:** There are no `<label>` tags anywhere in the form.
- **Error 24:** The input fields don't have unique `id` or `name` attributes, which means they can't actually collect or pass data securely.
- **Errors 25–26:** The email and phone fields are incorrectly typed as standard `type="text"`. They should be explicitly typed as `type="email"` and `type="tel"`.
- **Error 27:** The fields are thrown onto the page without any logical organization. They are missing structural wrapping blocks like `<fieldset>` and `<legend>`.

3. Breakdown of the 31 CSS Errors

General Layout Failures

- **Errors 28–30 (No Flexbox):** The global navigation lists rely on primitive inline block spacing instead of using Flexbox rules for easy alignment.
- **Errors 31–33 (No Grid):** The project gallery blocks are stacked rigidly on top of each other because there are no CSS Grid columns configured.
- **Errors 34–36 (No Responsive Design):** There are no `@media` queries in the entire stylesheet. The text, containers, and images don't adjust to changing screen sizes, causing layouts to break on mobile viewports.

Missing Precision Selectors

- **Errors 37–39:** The CSS rules only target broad element tags or single classes, failing the requirement to use 3+ unique combination selectors.
- **Errors 40–42:** Interactive states are completely missing. Links and buttons have zero `:hover`, `:focus`, or `:focus-visible` styles.
- **Errors 43–45:** Form styling relies on repeating the same classes over and over instead of cleanly targeting inputs with attribute selectors like `input[type="text"]`.

Static Interface & Visual Flaws

- **Errors 46–48:** Interactive layout cards snap instantly on hover because they are missing smooth `transition` timing curves.
- **Errors 49–51:** The interface lacks simple structural changes like `transform: scale()` or coordinate tweaks (`translate`) to make elements feel clickable.
- **Errors 52–54:** There are no custom `@keyframes` code structures defined, meaning the homepage loads as a completely static block without any entrance animations.
- **Errors 55–56:** Font families are written as raw values like `font-family: Arial;` without adding standard fallback font stacks (like `sans-serif`).
- **Error 57:** The hero text color blends right into the bright background image, creating a severe color contrast and readability issue.
- **Error 58:** Interactive buttons use default browser-blue borders instead of matching a clean project color palette.

4. Simple Fix Plan

Plaintext

Fix Step 1 —> Clean up the HTML code structure, fix the metadata, and swap out layout divs for semantic tags.

Fix Step 2 —> Build a clean "media/" folder, configure video/audio files, and embed a map iframe.

Fix Step 3 —> Rebuild the form with 7 input types, clean labels, and valid attribute tags.

Fix Step 4 —> Write clean Flexbox for the nav bar and responsive CSS Grid logic for the gallery.

Fix Step 5 —> Add hover styles, transition timings, keyframes, and run the code through the W3C validator.
